

FOR IMMEDIATE RELEASE

PHYLLOM'S grubGONE![®] ACHIEVES CALIFORNIA DPR (STATE REGISTRATION) MILESTONE, TARGETS LAWN GRUBS, PRESERVES BENEFICIAL INSECTS

Oakland, Calif., August 29, 2016 — Phyllom BioProducts Corp., the horticulture industry's innovation leader in microbial insect control, celebrates a California DPR approval for its novel grub control, grubGONE![®]. Now turf & lawn care pros and homeowners, concerned with unintended side effects, have a solution in grubGONE! that provides targeted, season long control of grubs in the season of application. What's more, the grubGONE! label has no application restrictions when plants are blooming or bees are foraging.

Untreated vs grubGONE! treated turf at Fowler Park, San Jose, California. 2.5 lbs grubGONE! per 1,000 sq. ft. applied June 2016. Field trial conducted by UCCE Alameda Co. IPM Specialist, Dr. Andrew Sutherland

Lawn grubs are a growing problem in maintained turfgrass in parks, sports fields, golf courses and home lawns. Not only will the grubs gnaw on roots, killing the grass, but grubs attract skunks and raccoons which dig up even more turf searching for food. The optimal grub control targets only the pest and leaves other creatures unharmed. Contrast this approach with traditional chemistry which commonly controls the target along with many beneficial predators such as typhia wasps, predator nematodes, ants and other creatures of a healthy root zone.

As we like to say “**Target the Pest, Not the Rest**®”.
